

config/routes.rb

```
get '/prices/new/:id', :to => 'price_commodities#new', :as  
=> 'price_commodity'
```

prices/new.html.erb

```
<% Commodity.all.each do |commodity| %>  
<li><%= link_to commodity.name, price_commodity_path(commodity) %></li>  
               "Corn" id=1 with a "flavor" of commodity?
```

price_commodities_controller.rb

```
@price = Price.new  
@commodity = Commodity.find(params[:id])
```

Is this close? How does a "1" for id get colored with the "commodity" so that it pulls it from that table?

price_commodities/new.html.erb

```
<%= form_for (@price), :url => prices_path do |f| %>
```

How does commodity_id get matched up between the price model and commodity model?
